

Project Title - COVID-19 Clinical Trials EDA Pandas Tool-PYTHON

Dataset: Dataset is available in the given link. You can download it at your convenience.

https://drive.google.com/file/d/1WessMr8tdADxk04uVT-AaoP3_CxwJIYR/view

Objective:

The objective is to explore the dataset to gain insights into the characteristics of COVID-19 clinical trials, such as their status, phases, study designs, and demographics.

Project Summary & Conclusion

1. What I Did

I analyzed a dataset of over 5,000 global **COVID-19 Clinical Trials**. My goal wasn't just to look at numbers, but to understand the story behind how the world's scientists responded to the pandemic. I used **Python** (specifically Pandas for data handling and Matplotlib/Seaborn for charts) to clean the messy raw data and turn it into clear, visual insights.

2. What the Data Showed (My Findings)

- When I visualized the data, a few really interesting patterns stood out:
- **The "April Rush":** I noticed a huge spike in new trials starting in **April and May 2020**. This shows exactly when the global scientific community kicked into high gear to find a cure.
- **The US Led the Way:** My geographical analysis showed that the **United States** conducted the most trials, followed by major countries in Europe and Asia.
- **Active Research:** I found that most of the trials in the dataset are either "**Recruiting**" or "**Completed**", which tells me that despite the pandemic slowing down, the research data is still active and valuable.
- **Inclusivity:** I was happy to see that the Gender distribution was very balanced. Most studies didn't restrict participants by gender, which is crucial for getting accurate medical results for everyone.

Conclusion

- This project was a great way for me to apply everything I've learned about Data Science in a real-world context. I successfully cleaned raw data, found meaningful trends, and even built a predictive model. It showed me how powerful data can be in tracking and understanding a global health crisis.
